

LM3411 Precision Secondary Regulator/Driver

General Description

The LM3411 is a low power fixed-voltage (3.3V or 5.0V) precision shunt regulator designed specifically for driving an optoisolator to provide feedback isolation in a switching regulator.

The LM3411 circuitry includes an internally compensated op amp, a bandgap reference, NPN output transistor, and voltage setting resistors.

A trimmed precision bandgap reference with temperature drift curvature correction, provides a guaranteed 1% precision over the operating temperature range (A grade version). The amplifier's inverting input is externally accessible for loop frequency compensation when used as part of a larger servo system. The output is an open-emitter NPN transistor capable of driving up to 15 mA of load current.

Because of its small die size, the LM3411 has been made available in the sub-miniature 5-lead SOT23-5 surface mount package. This package is ideal for use in space critical applications.

Although its main application is to provide a precision output voltage (no trimming required) and maintain very good regulation in isolated DC/DC converters, it can also be used with

other types of voltage regulators or power semiconductors to provide a precision output voltage without precision resistors or trimming.

Features

- Fixed voltages of 3.3V and 5.0V with initial tolerance of $\pm 1\%$ for standard grade and $\pm 0.5\%$ for A grade
- Custom voltages available (3V–17V)
- Wide output current range, 20 μA –15 mA
- Low temperature coefficient
- Available in 5-lead SOT23-5 surface mount package (tape and reel)

Applications

- Secondary controller for isolated DC/DC PWM switching regulators systems
- Use with LDO regulator for high-precision fixed output regulators
- Precision monitoring applications
- Use with many types of regulators to increase precision and improve performance

Five Lead Surface Mount Package Marking and Order Information (SOT23-5)

The small SOT23-5 package allows only 4 alphanumeric characters to identify the product. The table below contains the field information marked on the package.

	Grade	Order Information	Package Marking	Supplied as
3.3V	A (Prime)	LM3411AM5-3.3	D00A	1000 unit increments on tape and reel
3.3V	A (Prime)	LM3411AM5X-3.3	D00A	3000 unit increments on tape and reel
3.3V	B (Standard)	LM3411M5-3.3	D00B	1000 unit increments on tape and reel
3.3V	B (Standard)	LM3411M5X-3.3	D00B	3000 unit increments on tape and reel
5.0V	A (Prime)	LM3411AM5-5.0	D01A	1000 unit increments on tape and reel
5.0V	A (Prime)	LM3411AM5X-5.0	D01A	3000 unit increments on tape and reel
5.0V	B (Standard)	LM3411M5-5.0	D01B	1000 unit increments on tape and reel
5.0V	B (Standard)	LM3411M5X-5.0	D01B	3000 unit increments on tape and reel

FIGURE 1. SOT23-5 Marking and Order Information

The first letter "D" identifies the part as a Driver, the next two numbers indicate the voltage, "00" for 3.3V part and "01" for a 5V part. The fourth letter indicates the grade, "B" for standard grade, "A" for the prime grade.

The SOT23-5 surface mount package is only available on tape in quantities increments of 250 on tape and reel (indicated by the letters "M5" in the part number), or in quantities increments of 3000 on tape and reel (indicated by the letters "M5X" in the part number).

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Input Voltage $V_{(IN)}$	20V
Output Current	20 mA
Junction Temperature	150°C
Storage Temperature	-65°C to +150°C
Lead Temperature	
Vapor Phase (60 sec.)	+215°C
Infrared (15 sec.)	+220°C
Power Dissipation ($T_A = 25^\circ\text{C}$) (Note 2)	300 mW

ESD Susceptibility (Note 3)

Human Body Model 1500V
See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" for methods on soldering surface-mount devices.

Operating Ratings (Notes 1, 2)

Ambient Temperature Range	-40°C ≤ T_A ≤ +85°C
Junction Temperature Range	-40°C ≤ T_J ≤ +125°C
Output Current	15 mA

LM3411-3.3 Electrical Characteristics

Specifications with standard type face are for $T_J = 25^\circ\text{C}$, and those with **boldface type** apply over full Operating Temperature Range. Unless otherwise specified, $V_{(IN)} = V_{REG}$, $V_{OUT} = 1.5V$.

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{Jmax} (maximum junction temperature), θ_{JA} (junction to ambient thermal resistance), and T_{A} (ambient temperature). The maximum allowable power dissipation at any temperature is $(P_{\text{Dmax}} = T_{\text{Jmax}} - T_{\text{A}})/\theta_{\text{JA}}$ or the number given in the Absolute Maximum Ratings, whichever is lower. The typical thermal resistance (θ_{JA}) when soldered to a printed circuit board is approximately 306°C/W for the M5 package.

Note 3: The human body model is a 100 pF capacitor discharged through a $1.5\text{ k}\Omega$ resistor into each pin.

Note 4: Typical numbers are at 25°C and represent the most likely parametric norm.

Note 5: Limits are 100% production tested at 25°C . Limits over the operating temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's Averaging Outgoing Level (AOQL).

Note 6: Actual test is done using equivalent current sink instead of a resistor load.

Note 7: $V_{\text{SAT}} = V(\text{IN}) - V_{\text{OUT}}$, when the voltage at the IN pin is forced 100 mV above the nominal regulating voltage (V_{REG}).

Note 8: See Applications and Curves sections for information on this resistor.

Applications Information

DS011987-15

FIGURE 3. Isolated 250 mA Flyback Switching Regulator

DS011987-16

FIGURE 4. Isolated 1.5A Flyback Switching Regulator Using a LM2577

The LM3411 regulator/driver provides the reference and feedback drive functions in a regulated power supply. It can also be used together with many different types of regulators, (both linear and switching) as well as other power semiconductor devices to add precision and improve regulation specifications. Output voltage tolerances better than 0.5% are possible without using trim pots or precision resistors.

One of the main applications of the LM3411 is to drive an opto-isolator to provide feedback signal isolation in a switching regulator circuit. For low current applications, (up to 250 mA) the circuit shown in *Figure 3* provides good regulation and complete input/output electrical isolation.

For an input voltage of 15V, this circuit can provide an output of either 3.3V or 5V with a load current up to 250 mA with excellent regulation characteristics. With the part values shown, this circuit operates at 80 kHz., and can be synchronized to a clock or an additional LM3578. (See LM1578 data sheet for additional information.)

An isolated DC/DC flyback converter capable of higher output current is shown in *Figure 4*. This circuit utilizes the LM2577 SIMPLE SWITCHER™ voltage regulator for the Pulse Width Modulation (PWM), power switch and protection functions, while the LM3411 provides the voltage reference, gain and opto coupler drive functions. In this circuit, the reference and error amplifier in the LM2577 are not used (note that the feedback pin is grounded). The gain is provided by the LM3411. Since the voltage reference is located on the secondary side of the transformer, this circuit provides very good regulation specifications.

The output of a switching regulator typically will contain a small ripple voltage at the switching frequency and may also contain voltage transients. These transient voltage spikes can be sensed by the LM3411 and could give an incorrect regulation voltage. An RC filter consisting of a 1Ω resistor and a 100 nF capacitor will filter these transients and minimize this problem. The 1Ω resistor should be located on the ground side of the LM3411, and the capacitor should be physically located near the package.

Applications Information (Continued)

FIGURE 5. Precision 1A Buck Regulator

FIGURE 6. Negative Input, Negative or Positive Output Flyback Regulator

Improved output voltage tolerance and regulation specifications are possible by combining the LM3411A with one of the SIMPLE SWITCHER buck regulator IC's, such as the LM2574, LM2575, or LM2576. The circuit shown in *Figure 5* can provide a 5V, $\pm 0.5\%$ Output (1% over the operating temperature range) without using any trim-pots or precision resistors. Typical line regulation numbers are a 1 mV change on the output for a 8V–18V change on the input, and load regulation of 1 mV with a load change from 100 mA–1A.

A DC-DC flyback converter that accepts a negative input voltage, and delivers either a positive or negative output is shown in *Figure 6*. The circuit utilizes a buck regulator (such as the LM2574, LM2575, or LM2576, depending on how much output current is needed) operating in a flyback configuration. The LM3411 provides the reference and the required level shifting circuitry needed to make the circuit work correctly.

A unique feature of this circuit is the ability to ground either the high or low side of the output, thus generating either a negative or a positive output voltage. Although no isolation is

provided, with the addition of an opto-isolator and related components, this circuit could provide input/output isolation. Combining a LM3411A-5.0 with a 1A low dropout linear regulator results in a 5V $\pm 0.5\%$ (1% over the operating temperature range) regulator with excellent regulation specifications, with no trimming or 1% resistors needed.

An added benefit of this circuit (and also true of many of the other circuits shown here) is the high-side and low-side remote output voltage sensing feature. Sensing the output voltage at the load eliminates the voltage drops associated with wire resistance, thus providing near perfect load regulation.

A 5V, 1A regulator circuit featuring low dropout, very good regulation specifications, self protection features and allows output voltage sensing is shown in *Figure 7*. The regulator used is a LM2941 adjustable low dropout positive regulator, which also features an ON/OFF pin to provide a shutdown feature.

Applications Information (Continued)

FIGURE 10. Precision Negative Voltage Regulator

FIGURE 11. Precision Negative Voltage Regulator with Accurate Current Limit

A simple 5V supply monitor circuit is shown in *Figure 12*. Using the LM3411's voltage reference, op-amp (as a comparator) and output driver, this circuit provides a LED indication of the presence of the 5V supply.

FIGURE 12. 4.7V Power ON Detector with Hysteresis

The LM3411 initial room temperature tolerance is $\pm 1\%$ and $\pm 0.5\%$ for the "A" grade part. If a tighter tolerance is needed, a trim scheme is shown in *Figure 13* that provides approximately $\pm 1\%$ adjustment range of the regulation voltage (V_{REG}).

FIGURE 13. ± 50 mV External Trim

The LM3411 is guaranteed to drive a 15 mA load, but if more current is needed, a NPN boost transistor can be added. The circuit shown in *Figure 14* is a shunt regulator capable of providing excellent regulation over a very wide range of current.

FIGURE 14. 250 mA Shunt Regulator

Perhaps one of the simplest applications for the LM3411 is the voltage detector circuit shown in *Figure 15*. The OUT pin is low when the input voltage is less than V_{REG} . When the $V(IN)$ pin rises above V_{REG} , the OUT pin is pulled high by the internal NPN output resistor.

FIGURE 15. Voltage Detector

Also an overvoltage detector, the crowbar circuit shown in *Figure 16* is normally located at the output of a power supply to protect the load from an overvoltage condition should the power supply fail with an input/output short.
