TK705xxS/TK707xxS,TK706xxH/TK708xxH

1. DESCRIPTION

TK705xxS/TK707xxS and TK706xxH/TK708xxH is a low dropout linear regulator with ON/OFF control, which can supply 100mA load current.

The IC is an integrated circuit with a silicon monolithic bipolar structure.

The output voltage, trimmed with high accuracy, is available from 1.5 to 5.0V in 0.1V steps.

The packages are the small and thin SON2017-6, and the extremely versatile SOT23-5. The IC is designed for portable applications with space requirements, battery powered system and any electronic equipment.

Two kinds of pin configuration can be selected for each package.

The over current, over heat sensor and reverse bias over current protection circuits are built-in.

ESD is also high, so it won't break easily. It is possible to use at ease.

2. FEATURES

- Output current: 100mA, Peak 200mA
- Active high on/off control
- Excellent Ripple rejection ratio: 80dB (f=1kHz)
70dB (f=10kHz)
- Output capacitance: $C_{out} \geq 0.47\mu F$ (Ceramic)
- Output voltage accuracy: $\pm 1.5\%$ or $\pm 50mV$
- Short circuit protection (Over current protection)
- Internal thermal shutdown (Over heat protection)
- Reverse bias protection

3. APPLICATIONS

- Any Electronic Equipment
- Battery Powered Systems
- Mobile Communication

4. PIN CONFIGURATION

Top View

• SOT23-5

• SON2017-6

*2pin,5pin are connected in the IC.

*2pin,5pin are connected in the IC.

8. ABSOLUTE MAXIMUM RATINGS

Ta=25°C

Parameter	Symbol	Rating	Units	Conditions
Absolute Maximum Ratings				
Supply Voltage	V _{CC} _{MAX}	-0.4 ~ 16	V	
Reverse Bias	V _{rev} _{MAX}	-0.4 ~ 6	V	V _{out} ≤ 2.0V
		-0.4 ~ 12	V	2.1V ≤ V _{out}
Np pin Voltage	V _{np} _{MAX}	-0.4 ~ 5	V	
Control pin Voltage	V _{cont} _{MAX}	-0.4 ~ 16	V	
Storage Temperature Range	T _{stg}	-55 ~ 150	°C	
Power Dissipation	P _D	460 *1	mW	SOT23-5
		400 *2	mW	SON2017-6
Operating Condition				
Operating Temperature Range	T _{OP}	-40 ~ 85	°C	
Operating Voltage Range	V _{OP}	2.1 ~ 14	V	
Short Circuit Current	I _{short}	200	mA	Over Current Protection

*1 : Internal Limited T_j=140°C. P_D must be decreased at rate of 4.0 mW/°C for operation above 25°C.

*2 : Internal Limited T_j=140°C. P_D must be decreased at rate of 3.5 mW/°C for operation above 25°C.

The maximum ratings are the absolute limitation values with the possibility of the IC breakage.

When the operation exceeds this standard, quality cannot be guaranteed.

9. ELECTRICAL CHARACTERISTICS

The parameters with min. or max. values will be guaranteed at $T_a=T_j=25^{\circ}\text{C}$ with test when manufacturing or SQC(Statistical Quality Control) methods. The operation between $-40 \sim 85^{\circ}\text{C}$ is guaranteed when design.

$$V_{in}=V_{out_TYP}+1V, V_{cont}=1.8V, T_a=T_j=25^{\circ}\text{C}$$

Parameter	Symbol	Value			Units	Conditions

*1: For Vout ≤ 2.0V , no regulations.

*2: The output current is limited by power dissipation.

*3: The input current decreases to pA level when control terminal is connected to GND (Off state).

General Note: Parameter with only typical value is for reference only.

11. TYPICAL CHARACTERISTICS

11-1-1. DC CHARACTERISTICS

■ Line Regulation

Test conditions

■ Iin vs Vin Iout=0mA

■ Quiescent Current Iout=0mA

■ Load Regulation

■ Peak Output Current

■ GND Pin Current

Test conditions

■ Dropout Voltage

$$2.1V \leq V_{out_TYP}$$

■ Standby Current (Off state)

$$V_{cont} = 0V$$

■ Control Current

■ Control Current, ON/OFF Point

■ Vout vs Vin Regulation Point
 $2.1V \leq V_{out_TYP}$

Test conditions

■ Vout vs Vin Regulation Point
 $V_{out_TYP} = 1.5V$

■ Vout vs Vin Regulation Point
 $V_{out_TYP} = 2.0V$

■ Reverse Bias Current
 $V_{in} = 0V, V_{cont} = 0V$

Test conditions

11-1-2. Temperature Characteristics

■ Vout

$V_{out_TYP}=3.0V$

Test conditions

■ Peak Output Current

$V_{out}=V_{out_TYP} \times 0.9$

■ GND Pin Current

■ Dropout Voltage

$2.1V \leq V_{out_TYP}$

■ Quiescent Current

$I_{out}=0mA$

Test conditions

■ Load Regulation

$V_{out_Typ} = 3.0V$

■ Line Regulation

$\Delta V_{in} = 5V$

■ Control Current

■ ON/OFF Point

11-2. AC CHARACTERISTICS ($V_{out_TYP}=3.0V$)

Ripple Rejection

■ $C_{out}=0.22\mu F, 0.47\mu F, 1.0\mu F, 2.2\mu F$

■ $C_{np}=0.001\mu F, 0.01\mu F, 0.1\mu F$

Test conditions

■ $I_{out}=10mA, 20mA, 50mA, 100mA$

■ R.R vs I_{out} : Frequency=1kHz

■ R.R vs Low V_{in} : Frequency=1kHz

The ripple rejection (R.R) characteristic depends on the characteristic and the capacitance of the capacitor connected at the output side. Also it depends on the output voltage. The R.R characteristic at 50kHz or more varies greatly with the capacitor on the output side and PCB pattern. If necessary, please check stability during operation.

ON/OFF Transient

■ $C_{out}=0.47\mu F, 1.0\mu F, 2.2\mu F$

■ $C_{np}=0.001\mu F, 0.01\mu F, 0.1\mu F$

Test conditions

■ $C_{out}=0.47\mu F, 1.0\mu F, 2.2\mu F$

The rise time of the regulator depends on C_{out} and C_{np} .
The fall time depends on C_{out} .

LOAD Transient

Test conditions

■ $I_{out}=0 \Rightarrow 100\text{mA}$, $5 \Rightarrow 105\text{mA}$

■ $I_{out}=100\text{mA} \Rightarrow 0\text{mA}$, $105\text{mA} \Rightarrow 5\text{mA}$

■ Cout=0.47μF, 1.0μF, 2.2μF : Iout=0mA⇒100mA

■ Cout=0.47μF, 1.0μF, 2.2μF : Iout=100mA⇒0mA

Increase the load side capacitor when the load change is fast or when there is a large current change. In addition, at no load, supplying small load current to ground can reduce the voltage change.

LINE Transient

■ $C_{np}=0.001\mu\text{F}$, $0.01\mu\text{F}$, $0.1\mu\text{F}$

Test conditions

■ $C_{out}=0.1\mu\text{F}$, $0.22\mu\text{F}$, $0.47\mu\text{F}$

■ $C_{out}=1.0\mu\text{F}$, $2.2\mu\text{F}$

Output Noise Characteristics

■ Vout vs Noise

Test conditions

■ Cnp vs Noise

■ Iout vs Noise

Increase C_{np} to decrease the noise. The recommended C_{np} capacitance is $0.01\mu F \sim 0.1\mu F$. The amount of noise increases with the higher output voltages.

12. PIN DESCRIPTION

Pin No.	Pin Description	Internal Equivalent Circuit	Description
TK705xxS : 1 TK707xxS : 3 TK706xxH : 1 TK708xxH : 3	Vcont		On/Off Control Terminal $V_{CONT} > 1.8V$: ON $V_{CONT} < 0.35V$: OFF The pull-down resistor (500kΩ) is built-in.

13. APPLICATIONS INFORMATION

13-1. Definition of Technical Terms

Relating Characteristic

Note Each characteristics will be measured in a short period not to be influenced by joint temperature (T_j).

◆Output voltage (V_{out})

The output voltage is specified with $V_{in} = V_{out_TYP} + 1V$ and $I_{out} = 5mA$

◆Output current (I_{out})

Output current, which can be used continuously (It is the range where overheating protection of the IC does not operate.)

◆Peak maximum output current (I_{out_PEAK})

The rated output current is specified under the condition where the output voltage drops 90% by increasing the output current, compared to the value specified at $V_{in} = V_{out_TYP} + 1V$.

◆Dropout voltage (V_{drop})

It is an I/O voltage difference when the circuit stops the stable operation by decreasing the input voltage.

It is measured when the output voltage drops 100mV from its nominal value by decreasing the input voltage gradually.

◆Line Regulation ($LinReg$)

It is the fluctuations of the output voltage value when the input voltage is changed.

◆Load Regulation ($LoaReg$)

It is the fluctuations of the output voltage value when the input voltage is assumed to be $V_{out_TYP} + 1V$, and the load current is changed.

◆Ripple Rejection ($R.R$)

Ripple rejection is the ability of the regulator to attenuate the ripple content of the input voltage at the output. It is measured with the condition of $V_{in} = V_{out} + 1.5V$. Ripple rejection is the ratio of the ripple content between the output vs. input and is expressed in dB.

◆Standby current ($I_{standby}$)

It is an input current, which flows to the control terminal, when the IC is turned off.

Relating Protection Circuit

◆Over Current Protection

It is a function to protect the IC by limiting the output current when excessive current flows to IC, such as the output is connected to GND, etc.

◆Thermal Protection

It protects the IC not to exceed the permissible power consumption of the package in case of large power loss inside the regulator.

The output is turned off when the chip reaches around $140^{\circ}C$, but it turns on again when the temperature of the chip decreases.

◆Reverse Voltage Protection

Reverse voltage protection prevents damage due to the output voltage being higher than the input voltage. This fault condition can occur when the output capacitor remains charged and the input is reduced to zero, or when an external voltage higher than the input voltage is applied to the output side

Generally, a LDO regulator has a diode in the input direction from an output. If an input falls from an output in an input-GND short circuit etc. and this diode turns on, current will flow for an input terminal from an output terminal. In the case of excessive current, IC may break.

In order to prevent this, it is necessary to connect an Schottky Diode etc. outside.

This product is equipped with reverse bias over-current prevention, and excessive current does not flow in to IC. Therefore, no need to connect diode outside.

◆ESD

It is tested by connecting charged capacitor to GND pin and V_{in} pin.

MM	200pF	0Ω	200Vmin
HBM	100pF	1.5kΩ	2000Vmin

13-2. ESR Stability

Linear regulators require input and output capacitors in order to maintain the regulator's loop stability. If 0.22 μ F or larger capacitor is connected to the output side, the IC provides stable operation at any voltage (1.3V $\leq$ V_{out_TYP} $\leq$ 5.0V). (The capacitor must be larger than 0.22 μ F at all temperature and voltage range) If the capacitor with high Equivalent Series Resistance (ESR) (several ohms) is used, such as tantalum capacitor etc., the regulator may oscillate. Please select parts with low ESR.

Due to the parts are uneven, please enlarge the capacitance as much as possible. With larger capacity, the output noise decreases more. In addition, the response to the load change, etc. can be improved. The IC won't be damaged by enlarging the capacity.

A recommended value of the application is as follows.

$C_{in}=C_{out}\geq 0.47\mu\text{F}$ Ceramic Capacitance

Fig.13-2

Output Voltage, Output Current vs. Stable Operation Area

1.5V $\leq$ V_{out_TYP} $\leq$ 5.0V

Fig.13-2 shows stable operation with a ceramic capacitor of 0.22 μ F. Since it may oscillate if ESR is large, we recommend using ceramic capacitor.

The stability of the regulator improves with larger output capacitor (the stable operation area extends.) Please use the capacitor with larger capacitance as possible.

For evaluation

Kyocera: CM05B104K10AB, CM05B224K10AB, CM105B104K16A, CM105B224K16A, CM21B225K10A

Murata: GRM36B104K10, GRM42B104K10, GRM39B104K25, GRM39B224K10, GRM39B105K6.3

The input capacitor is necessary in case the battery voltage drops, the power supply impedance increases, or the distance to the power supply is far. 1 input capacitor might be necessary for each IC or for several ICs. It depends on circuit condition. Please confirm the stability by each circuit.

Fig.13-3

ex. Ceramic Capacitance vs. Voltage, Temperature

Generally, a ceramic capacitor has both temperature characteristic and voltage characteristic. Please consider both characteristics when selecting the part. The B curves are the recommend characteristics.

13-3. Operating Region and Power Dissipation

The power dissipation of the device depends on the junction temperature. Therefore, the package dissipation is assumed to be an internal limitation. The package itself does not have enough heat radiation characteristic due to the small size. Heat runs away by mounting IC on PCB. This value changes by the material, copper pattern etc. of PCB.

The overheating protection operates when there is a lot of loss inside the regulator (Ambient temperature high, heat radiation bad, etc.). The output current and the output voltage will drop when the protection circuit operates. When joint temperature (Tj) reaches the set temperature, IC stops the operation. However, operation begins at once when joint temperature (Tj) decreases.

The thermal resistance when mounted on PCB

The chip joint temperature during operation is shown by $T_j = \theta_{ja} \times P_d + T_a$. Joint part temperature (Tj) of TK705xxS/TK707xxS/TK706xxH/TK708xxH is limited around 140°C with the overheating protection circuit. Pd is the value when the overheating protection circuit starts operation.

When you assume the ambient temperature to be 25°C,
 $140 = \theta_{ja} \times P_d (W) + 25$
 $\theta_{ja} \times P_d = 115$
 $\theta_{ja} = 115 / P_d (^\circ C / W)$

Example of mounting substrate

PCB Material: Two layer glass epoxy substrate
(x=30mm,y=30mm,t=1.0mm,Copper pattern thickness 35um)

TK705xxS/TK707xxS (SOT23-5)

Please do the derating with 5.9mW/°C at Pd=677mW and 25°C or higher. Thermal resistance (θ_{ja}) is 170°C/W.

TK706xxH/TK708xxH (SON2017-6)

Please do the derating with 4.9mW/°C at Pd=560mW and 25°C or higher. Thermal resistance (θ_{ja}) is 205°C/W.

Method of obtaining Pd easily

Connect output terminal to GND(short circuited), and measure the input current by increasing the input voltage gradually up to 10V. The input current will reach the maximum output current, but will decrease soon according to the chip temperature rising, and will finally enter the state of thermal equilibrium (natural air cooling).

The input current and the input voltage of this state will be used to calculate the Pd.

$$P_d (mW) \cong V_{in} (V) \times I_{in} (mA)$$

When the device is mounted, mostly achieve
TK705xxS/TK707xxS (SOT23-5): **580mW** or more
TK706xxH/TK708xxH (SON2017-6): **500mW** or more

*In case that the power, $V_{in} \times I_{short}$ (Short Circuit Current), becomes more than the maximum rating of its power dissipation, the IC may damaged before internal thermal protection works.

The maximum output current at the highest operating temperature will be $I_{out} \cong DPd \div (V_{inmax} - V_{out})$.

Please use the device at low temperature with better radiation. The lower temperature provides better quality.

13-4. ON/OFF Control

It is recommended to turn the regulator off when the circuit following the regulator is not operating. A design with small electric power loss can be implemented.

Because the control current is small, it is possible to control it directly by CMOS logic.

Control Terminal Voltage (Vcont)	ON/OFF State
$V_{cont} > 1.8V$	ON
$V_{cont} < 0.35V$	OFF

Parallel Connected ON/OFF Control

Fig.13-4

Fig.13-4 shows the multiple regulators being controlled by a single ON/OFF control signal. There is fear of overheating, because the power loss of the low voltage side (TK70520S) is large. The series resistor (R) is put in the input line of the low output voltage regulator in order to prevent over-dissipation. The voltage dropped across the resistor reduces the large input-to-output voltage across the regulator, reducing the power dissipation in the device. When the thermal sensor works, a decrease of the output voltage, oscillation, etc. may be observed.

13-5. Noise Bypass

The noise characteristics depend on the capacitance on the Np terminal.

A standard value is $C_{np}=0.001\mu F$. Increase C_{np} in a design with important output noise requirements. The IC will not be damaged even the capacitor value is increased.

The on/off switching speed changes depending on the Np terminal capacitance. The switching speed slows when the capacitance is large.

13-6. The notes of the evaluation when output terminal is short-circuit to GND

By the resonance phenomenon by Cout (C ingredient) and the short circuit line (L ingredient), which are attached to an output terminal, an output terminal changes with minus potential. In order that Parasitism Tr arises within Bip IC, and a latch rise phenomenon may occur within IC when the worst if it goes into an output terminal's minus side, it results in damage by fire (white smoke) and breakage of a package. ($f_0 = 1 / 2\pi\sqrt{L C}$)

The above-mentioned resonance phenomenon appears notably in a ceramic capacitor with the small ESR value, etc. A resonance phenomenon can be reduced by connecting resistance (around 20ohms or more) in series with a short circuit line. Thereby, the latch rise phenomenon within IC can be prevented.

Generally, when using tantalum or large electrolysis capacitor, the influence of resonance phenomenon can be reduced due to the large ESR (20ohms or more).

14. NOTES

■ Please be sure that you carefully discuss your planned purchase with our office if you intend to use the products in this application manual under conditions where particularly extreme standards of reliability are required, or if you intend to use products for applications other than those listed in this application manual.

- Power drive products for automobile, ship or aircraft transport systems; steering and navigation systems, emergency signal communications systems, and any system other than those mentioned above which include electronic sensors, measuring, or display devices, and which could cause major damage to life, limb or property if misused or failure to function.

- Medical devices for measuring blood pressure, pulse, etc., treatment units such as coronary pacemakers and heat treatment units, and devices such as artificial organs and artificial limb systems which augment physiological functions.

- Electrical instruments, equipment or systems used in disaster or crime prevention.

■ Semiconductors, by nature, may fail or malfunction in spite of our devotion to improve product quality and reliability. We urge you to take every possible precaution against physical injuries, fire or other damages which may cause failure of our semiconductor products by taking appropriate measures, including a reasonable safety margin, malfunction preventive practices and fire-proofing when designing your products.

■ This application manual is effective from Aug. 2005. Note that the contents are subject to change or discontinuation without notice. When placing orders, please confirm specifications and delivery condition in writing.

■ TOKO is not responsible for any problems nor for any infringement of third party patents or any other intellectual property rights that may arise from the use or method of use of the products listed in this application manual. Moreover, this application manual does not signify that TOKO agrees implicitly or explicitly to license any patent rights or other intellectual property rights which it holds.

■ None of the ozone depleting substances(ODS) under the Montreal Protocol are used in our manufacturing process.
